

# Docmee Platform Requirements

## *AI Chatbot Platform for Clinics, Doctors, and Medical Secretaries*

**General objective:** Build a specialized AI chatbot platform for clinics. The first version should focus only on Docmee, not on a multi-brand or multi-industry product. The platform must help clinics answer patients, transfer conversations to secretaries, schedule and confirm appointments, organize patient communication, and comply with Meta requirements.

## Development Phases

### Phase 1 - MVP

- IA Studio admin panel.
- Clinic panel.
- Users and roles per clinic.
- WhatsApp as the first channel.
- Unified inbox.
- AI bot per clinic.
- Bot/human handoff.
- Rule to prevent the bot from interrupting humans.
- Editable clinic knowledge base.
- Google Calendar integration.
- Appointment scheduling and confirmation.
- Patient data capture.
- Audio transcription.
- Basic tags and statuses.
- Meta compliance foundation.

### Phase 2 - Professional Operation

- Facebook Messenger.
- Instagram Direct Messages.
- Conversation assignment.
- Internal notes.
- Quick reply templates.
- Patient history.
- Basic metrics.
- Secretary alerts.
- Follow-up automation.
- Error review area.

### Phase 3 - Scaling

- Multi-doctor clinics.
- Document upload for training.

- Advanced clinic rules.
- Custom flows.
- Google Sheets or CRM integration.
- Automatic reports.
- Review request automation.
- Internal AI assistant for secretaries.
- Responsive web panel, PWA, or mobile app.
- Advanced analytics.

## Phase Summary Table

| Phase   | Goal                                 | Main Deliverables                                                                                                   |
|---------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Phase 1 | Launch a reliable clinic-focused MVP | Admin panel, clinic panel, WhatsApp inbox, AI bot, human handoff, Google Calendar, patient data, Meta compliance.   |
| Phase 2 | Improve daily clinical operation     | Messenger, Instagram, assignments, notes, templates, history, metrics, alerts, follow-ups, error review.            |
| Phase 3 | Scale and improve the product        | Multi-doctor support, documents, advanced rules, flows, CRM/Sheets, reports, review automation, app/PWA, analytics. |

### 1. Main Admin Panel for IA Studio

- Create new clinics.
- Activate or deactivate clinics.
- Create users for each clinic.
- Assign roles and permissions.
- Access each clinic chatbot settings.
- View conversations by clinic.
- Manage connected channels.
- Review errors or failed conversations.
- Monitor chatbot performance.
- Control billing or plans in the future.
- Manage integrations such as WhatsApp, Facebook, Instagram, and Google Calendar.

### 2. Clinic Panel

- Each clinic should have its own private panel.
- A single clinic should support multiple users: doctor, secretary, clinic administrator, and assistant.
- Each user should have permissions based on role.
- A secretary can reply to chats and manage appointments.
- A doctor can review conversations, appointments, and reports.
- An administrator can manage clinic settings.

- IA Studio can access and control everything.
- Each clinic must be completely separated from other clinics.

### 3. Initial Communication Channels

- WhatsApp Business API should be the first priority.
- Facebook Messenger should be added after WhatsApp.
- Instagram Direct Messages should be added after WhatsApp.
- All conversations from connected channels should appear in one unified inbox.

### 4. Unified Inbox

- Active conversations.
- Conversations handled by the bot.
- Conversations assigned to a secretary.
- Closed conversations.
- Patient name and phone number.
- Channel of origin: WhatsApp, Facebook, or Instagram.
- Full conversation history.
- Conversation status.
- Tags.
- Internal notes.
- Appointment status.
- Last interaction date and time.

### 5. Bot Mode and Human Mode

- Activate the bot.
- Pause the bot.
- Transfer the conversation to a secretary.
- Return the conversation back to the bot.
- Detect phrases such as: I want to talk to a person, Can the secretary call me, I do not understand, I need help, or I prefer to speak with a human.
- When detected, the bot should transfer to a human or mark the conversation as urgent.

### 6. Critical Rule: The Bot Must Not Interrupt

- If a human replies, the bot is automatically paused for that conversation.
- If the conversation is assigned to a secretary, the bot does not respond.
- The bot can only be reactivated manually or after a defined timeout.
- The platform should clearly show whether the conversation is in bot mode or human mode.
- This is critical because a bot interrupting a secretary can create confusion and damage trust.

## 7. AI Knowledge Base Per Clinic

- Each clinic must have its own knowledge base.
- The bot should answer based only on the specific information of that clinic.
- Information can include doctor name, specialty, services, address, opening hours, prices if allowed, insurance, pre-consultation instructions, FAQs, policies, payment methods, location links, contact numbers, and clinic rules.
- IA Studio must be able to add, edit, and update this information easily.
- The bot must not mix information from one clinic with another.

## 8. Audio Messages

- Patient sends an audio message.
- The system transcribes the audio.
- The AI understands the message.
- The bot replies in text.
- Audio replies can be considered in a future version, but are not required for the first version.

## 9. Google Calendar Integration

- Read availability.
- Schedule appointments.
- Confirm appointments.
- Reschedule appointments.
- Cancel appointments if allowed.
- Check if a patient already has an appointment.
- Read the calendar when a patient asks if their appointment is confirmed.
- If the bot cannot find the appointment, it should transfer the conversation to the secretary.

## 10. Patient Data Capture

- Full name.
- Phone number.
- Reason for consultation.
- Preferred date.
- Preferred time.
- Doctor or specialty if applicable.
- New patient or returning patient.
- Channel of origin.
- Notes or special requests.

## 11. Tags and Conversation Statuses

- Suggested tags: New patient, Returning patient, Wants appointment, Emergency, Pending reply, Appointment scheduled, No response, Follow-up, Quote requested, Insurance, Surgery, Urgent, Human requested.
- Suggested statuses: Open, Handled by bot, Handled by secretary, Pending, Closed, Requires follow-up, Appointment scheduled.

## 12. Conversation Assignment

- Assign conversations to Secretary 1, Secretary 2, Doctor, or Administrator.
- This is important when a clinic has more than one person answering messages.

## 13. Internal Notes

- Users should be able to add internal notes inside conversations.
- These notes must not be visible to the patient.
- Example: Patient asked about surgery. Follow up tomorrow.

## 14. Follow-Ups and Reminders

- Appointment reminder one day before.
- Appointment confirmation.
- Post-consultation message.
- Follow-up 7 days after appointment.
- Follow-up 3 months after appointment.
- Review request after appointment.
- Message if the patient did not reply.
- Some follow-ups may require approved WhatsApp templates depending on Meta rules.

## 15. Quick Reply Templates

- Clinic address.
- Opening hours.
- Appointment price.
- Payment methods.
- Appointment requirements.
- Confirmation message.
- Review request.
- Follow-up message.
- A secretary will contact you shortly.

## 16. Patient History

- Previous conversations.

- Previous appointments.
- Current status.
- Internal notes.
- Tags.
- Last interaction.
- Next appointment.
- This is not a medical record. It is only for communication and appointment management.

## 17. Basic Metrics

- Total conversations.
- Conversations by channel.
- New patient leads.
- Appointment requests.
- Appointments scheduled.
- Conversations transferred to secretary.
- Most common questions.
- Peak activity hours.
- Conversations without response.
- Conversion rate from conversation to appointment.

## 18. Alerts for the Secretary

- Patient wants to speak with a human.
- Bot does not know how to answer.
- Someone requests an appointment.
- A conversation is urgent.
- A patient seems upset.
- An appointment needs confirmation.
- A patient sends several messages without response.

## 19. Meta Compliance and Account Protection

- Correct use of WhatsApp Business API.
- Meta Business Manager verification.
- Correct setup inside Meta Developers.
- Required permissions for WhatsApp, Facebook, and Instagram.
- Correct webhook configuration.
- Secure storage of access tokens.
- Token renewal or expiration management.
- Respecting WhatsApp conversation windows.
- Use of approved message templates when required.
- No mass messaging without user consent.
- Consent management.

- Opt-out options.
- Anti-spam controls.
- Message quality monitoring.
- Error logs related to Meta.
- Compliance with Meta messaging policies, WhatsApp Business policies, and automation policies.

## 20. Medical Safety Rules

- The bot should not diagnose patients.
- The bot should not prescribe medications.
- The bot should not recommend treatments.
- The bot should not interpret exams or lab results.
- The bot should not replace a doctor.
- The bot can say: For a proper evaluation, it is best to schedule an appointment with the doctor.
- For urgent or emergency messages, the bot should recommend contacting emergency services or the clinic directly, depending on clinic-approved instructions.

## 21. Spanish and English Panel

- The platform should support Spanish and English.
- The user should be able to change the panel language.
- This applies to the IA Studio admin panel, clinic panel, menus, buttons, statuses, alerts, system messages, reports, and notifications.
- The panel language is different from the chatbot language.

## 22. Spanish and English Chatbot

- The chatbot should understand and reply in the patient language when possible.
- Initial chatbot languages: Spanish and English.
- If the patient writes in English, the bot should reply in English using only the clinic approved information.

## 23. Mobile App Vision

- The platform should eventually have a mobile app similar to platforms like UChat.
- The app should allow users to view conversations, reply to messages, receive notifications, take control of conversations, pause or activate the bot, view patient details, view appointments, confirm appointments, receive alerts, review pending conversations, and add internal notes.
- Recommended stages: responsive web panel, PWA installable on mobile, then native app for iOS and Android.

## 24. Notifications

- Patient wants to speak with a secretary.

- Patient requests an appointment.
- Bot could not answer.
- Patient seems upset.
- Patient sent an audio message.
- Appointment needs confirmation.
- Conversation has been waiting too long.
- New important lead.
- Notifications should ideally work through web panel, email, mobile app or PWA, and possibly internal WhatsApp in a future stage.

## 25. Document Training

- Future support for PDF, Word, text, FAQ files, clinic information documents, service lists, protocols, and doctor profiles.
- The AI should use these documents as part of the clinic knowledge base.

## 26. Bot Tone Control

- Formal.
- Friendly.
- Professional.
- Short and direct.
- More detailed.
- Medical secretary style.

## 27. Clinic-Specific Rules

- Do not share prices.
- Only share consultation price.
- Do not answer medical questions.
- Always transfer emergency cases.
- Do not schedule without payment confirmation.
- Outside business hours, only collect patient data.
- Transfer certain cases to the secretary.

## 28. Custom Flows

- Schedule appointment.
- Reschedule appointment.
- Confirm appointment.
- Ask for location.
- Ask for price.
- Ask about surgery.
- Post-consultation follow-up.

- Request a review.
- Ask about insurance.

## 29. Error Review Area

- Questions the bot could not answer.
- Conversations where the bot asked for help.
- Bad responses.
- Human handoffs.
- Unrecognized intents.
- Meta API errors.
- Google Calendar errors.
- Failed messages.

## 30. Multi-Doctor Clinics

- Multiple doctors inside one clinic.
- Separate calendar per doctor.
- Services by doctor.
- Opening hours by doctor.
- FAQs by doctor.
- Appointment scheduling based on selected doctor.

## 31. Google Sheets or CRM Integration

- Patient name.
- Phone number.
- Service of interest.
- Date of contact.
- Scheduled appointment: yes/no.
- Source: WhatsApp, Facebook, or Instagram.
- Conversation status.

## 32. Quality of Service Monitoring

- Upset patients.
- Abandoned conversations.
- Secretary response time.
- Bot response time.
- Conversations without closure.
- Most common reasons patients do not schedule.
- Follow-up opportunities.

## Key Clarification

**We do not want to build a general chatbot tool at this stage.** We want to build Docmee, a specialized AI chatbot platform for clinics. The platform should be clean and scalable, but the first goal is not to serve every industry. The first goal is to make Docmee work extremely well for doctors, clinics, secretaries, medical appointment management, patient communication, WhatsApp automation, Google Calendar scheduling, and human handoff.
